

# Busy Bees at Work!

You may notice a lot of insects flying around this area:  
*These are hard-working wild bees; their tiny nests resemble ant hills*

## These bees are:

- **Solitary**: each female has her own nest although many nests can occur in the same area
- **Gentle**: these bees are not aggressive and are very unlikely to sting
- **Beneficial & hard-working**: wild bees can be excellent pollinators; they can be more efficient than honey bees!
- **Temporary**: adult bees of a given species are often only active for a few weeks & will disappear on their own
